

Quiz 4 Answers

1. What are the three parts of a Makefile rule?

A Makefile rule consists of a target, a dependency list, and a command.

2. Give a brief description of what a *target* is with respect to a Makefile rule.

The target in a Makefile rule is usually the name of a file that is to be made as part of the project.

3. Give a brief description of what a *dependency list* is with respect to a Makefile rule.

A dependency list is a list of files which must all exist and be up to date in order to create the target.

4. Give an example of a *pseudo-target* that might appear in a Makefile.

`clean` is a commonly used pseudo-target.

5. A class, `Widget`, has as one of its members a method named `print()` that takes no arguments. A variable of type `Widget` is declared named `temp`. Write the C++ expression to call the `print` function for the object `temp`.

```
temp.print();
```

6. What name is given to public methods that are used to retrieve or set the private data members of a class?

Accessor methods (set and get methods is also an acceptable answer).

(Next two questions) Given the following:

```
double pi = 3.14159;
double* piPtr = &pi;
```

Assume that `pi` is stored at address 200 and `piPtr` is stored at address 400.

7. What is the value of `*piPtr`?

3.14159 (The value of the variable pointed to by `piPtr`, which is the value of the variable `pi`.)

8. What is the value of `piPtr`?

200 (The address stored in the pointer variable `piPtr`, which is the address of the variable `pi`.)

9. After three passes through the outer loop of a sorting algorithm, an array changes from

| | | | | | | | |
|----|----|----|----|----|----|----|----|
| 26 | 10 | 67 | 54 | 18 | 41 | 30 | 28 |
|----|----|----|----|----|----|----|----|

to

| | | | | | | | |
|----|----|----|----|----|----|----|----|
| 10 | 26 | 54 | 67 | 18 | 41 | 30 | 28 |
|----|----|----|----|----|----|----|----|

What sorting algorithm is being used to sort the array?

- A. Selection sort
- B. Insertion sort
- C. Bubble sort

The correct answer is insertion sort. The sort will progress as follows (the shaded portion of the array represents the sorted subarray):

| | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|
| Initial array | 26 | 10 | 67 | 54 | 18 | 41 | 30 | 28 |
|---------------|----|----|----|----|----|----|----|----|

| | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|
| End of Pass 1 | 10 | 26 | 67 | 54 | 18 | 41 | 30 | 28 |
|---------------|----|----|----|----|----|----|----|----|

| | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|
| End of Pass 2 | 10 | 26 | 67 | 54 | 18 | 41 | 30 | 28 |
|---------------|----|----|----|----|----|----|----|----|

| | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|
| End of Pass 3 | 10 | 26 | 54 | 67 | 18 | 41 | 30 | 28 |
|---------------|----|----|----|----|----|----|----|----|

10. The binary search algorithm is used to search the following array for the value 59. In the table below, list the values for the subscript variables `low`, `high`, and `mid` for each pass through the algorithm's `while` loop. (There may be fewer than five passes.)

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| 10 | 19 | 24 | 37 | 42 | 48 | 52 | 59 | 65 | 78 |
|----|----|----|----|----|----|----|----|----|----|

The key 59 will be found on the second pass, when `mid == 7`:

| Pass | low | high | mid |
|------|-----|------|-----|
| 1 | 0 | 9 | 4 |
| 2 | 5 | 9 | 7 |
| 3 | | | |
| 4 | | | |
| 5 | | | |
