Introduction to Database Concepts

What is a Database?

Database Management System (DBMS)

Other Capabilities of DBMS Systems

Leveled Architecture of a DBMS

Basic Database Terminology

WHAT IS A DATABASE?

- ▶ A collection of stored operational data used by the application systems of some particular enterprise.
- ▶ From the book - “a collection of related data”

ENTERPRISE?

Enterprise

- ▶ a generic term for any reasonably large-scale commercial, scientific, technical, or other application
 - ▶ manufacturing
 - ▶ financial
 - ▶ medical
 - ▶ university
 - ▶ government

OPERATIONAL DATA

Operational data is

- ▶ Data maintained about the operation of an enterprise
 - ▶ products
 - ▶ accounts
 - ▶ patients
 - ▶ students
 - ▶ plans
- ▶ Notice that this **DOES NOT** include input/output data

DATABASE MANAGEMENT SYSTEM (DBMS)

A Database Management System (DBMS) is

- ▶ a collection of programs that enables users to create and maintain a database
- ▶ a general-purpose software system that facilitates
 - ▶ definition of databases
 - ▶ construction of databases
 - ▶ manipulation of data within a database
 - ▶ sharing of data between users/applications

DEFINING A DATABASE

For the data being stored in the database, defining the database specifies

- ▶ the data types
- ▶ the structure(s)
- ▶ the constraints

CONSTRUCTING A DATABASE

- ▶ The process of storing the data itself on some storage device
- ▶ The storage device is controlled by the DBMS

MANIPULATING A DATABASE

Includes functions that

- ▶ retrieve specific information in a query
- ▶ update the database to include changes
- ▶ generate reports from the data

SHARING A DATABASE

- ▶ Allows multiple users and programs to access the database at the same time
- ▶ Any conflicts between applications are handled by the DBMS

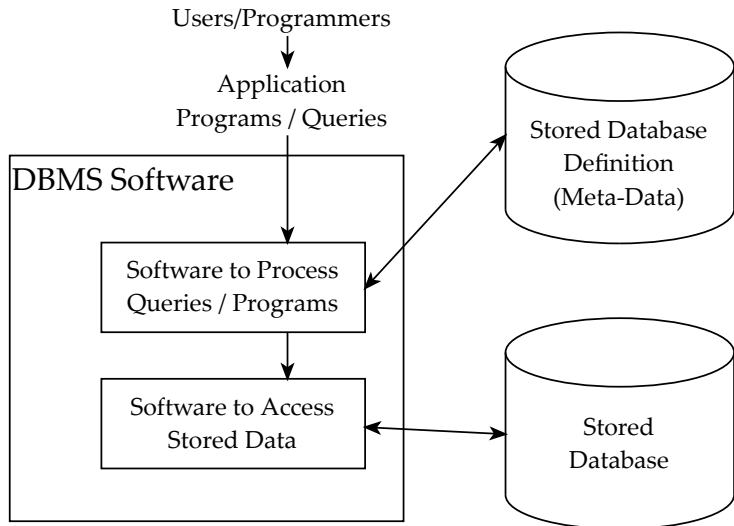

OTHER IMPORTANT FUNCTIONS OF A DATABASE

Other important functions provided by a DBMS include

- ▶ Protection
 - ▶ System protection
 - ▶ Security protection
- ▶ Maintenance
 - ▶ Allows updates to be performed easily

SIMPLIFIED DATABASE SYSTEM ENVIRONMENT

WHAT IS A DATABASE SYSTEM?

Main characteristics of a database system are:

- ▶ Self-describing nature of a database system
- ▶ Insulation between programs and data, and data abstraction
- ▶ Support for multiple views of the data
- ▶ Sharing of data and multi-user transaction processing

OTHER CAPABILITIES OF DBMS SYSTEMS

Support for at least one data model through which the user can view the data

- ▶ There is at least one abstract model of data that allows the user to see the “information” in the database
- ▶ Relational, hierarchical, network, inverted list, or object-oriented

OTHER CAPABILITIES OF DBMS SYSTEMS

Support for at least one data model through which the user can view the data

- ▶ efficient file access which allows us to “find the boss of Susie Jones”
- ▶ allows us to “navigate” within the data
- ▶ allows us to combine values in 2 or more databases to obtain “information”

OTHER CAPABILITIES OF DBMS SYSTEMS

Support for high-level languages that allow the user to define the structure of the data, access that data, and manipulate it

- ▶ Data Definition Language (DDL)
- ▶ Data Manipulation Language (DML)
- ▶ Data Control Language (DCL)
- ▶ query language access data
- ▶ operations such as add, delete, and replace

TRANSACTION MANAGEMENT

Transaction management is a feature that provides correct, concurrent access to the database, possibly by many users at the same time

- ▶ ability to simultaneously manage large numbers of *transactions*
 - ▶ procedures operating on the database
 - ▶ often transactions come from around the world
 - ▶ “lock-out” mechanisms

ACCESS CONTROL

Access control is the ability to limit access to data by unauthorized users along with the capability to check the validity of the data

- ▶ protect against loss when database crashes
- ▶ prevent unauthorized access to portions of the data

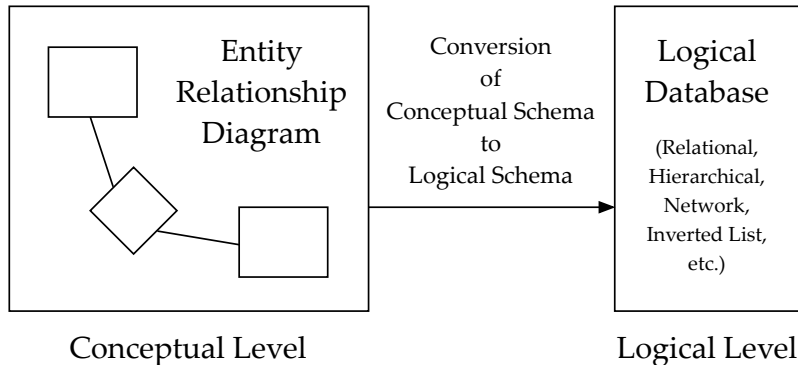

RESILIENCY

Resiliency is the ability to recover from system failures without losing data

- ▶ Ideally, should be able to recover from **any** type of failure.
 - ▶ sabotage
 - ▶ acts of God
 - ▶ hardware failure
 - ▶ software failure
 - ▶ etc.
- ▶ Obviously, some of these would require more than just software - offsite backups, etc.

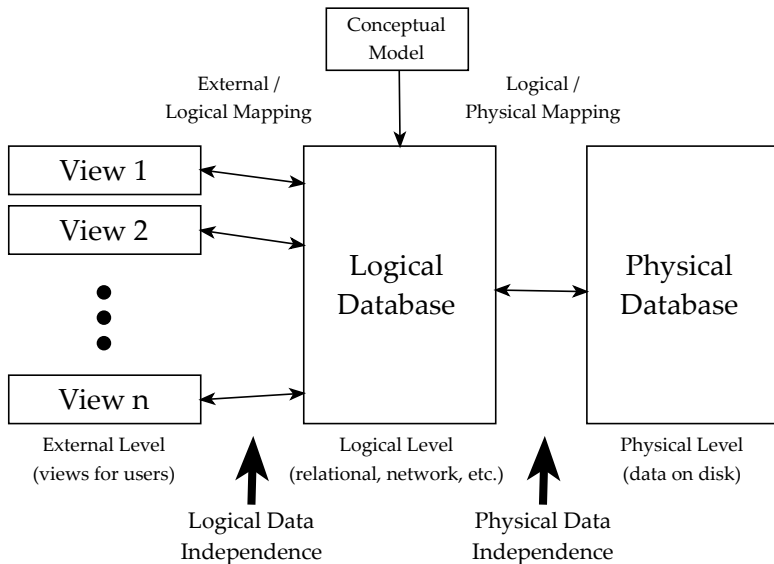

USE OF CONCEPTUAL MODELING

LEVELED ARCHITECTURE OF A DBMS

EXTERNAL LEVEL

a view or sub-schema

- ▶ portion of the logical database
may be in a higher level language

LOGICAL LEVEL

- ▶ abstraction of the real world as it pertains to the users of the database
- ▶ DBMS provides a data definition language (DDL) to describe the logical schema in terms of a specific data model such as relational, hierarchical, network, inverted list, etc.

PHYSICAL LEVEL

- ▶ the collection of files and indices
- ▶ stored on secondary storage device (HDD, SSD, etc.)
- ▶ this is the actual data

INSTANCE

An instance of the database is the actual contents of the data

- ▶ the *extension* of the database
- ▶ current state of the database
- ▶ a snapshot of the data at a given point in time

SCHEMA

The *schema* of a database is the data about what the data represents.

- ▶ plan of the database
- ▶ logical plan
- ▶ physical plan
- ▶ the *intention* of the database

SCHEMA VS. INSTANCE

Schema

description of
what data can
be stored

Instance

the actual
data that is
stored

DATA INDEPENDENCE

Data Independence is a property of an appropriately designed database system

- ▶ has to do with the mapping of logical level to physical level, and logical to external
- ▶ physical data independence
 - ▶ physical schema can be changed without modifying logical schema
- ▶ logical data independence
 - ▶ logical schema can be changed without having to modify any of the external views

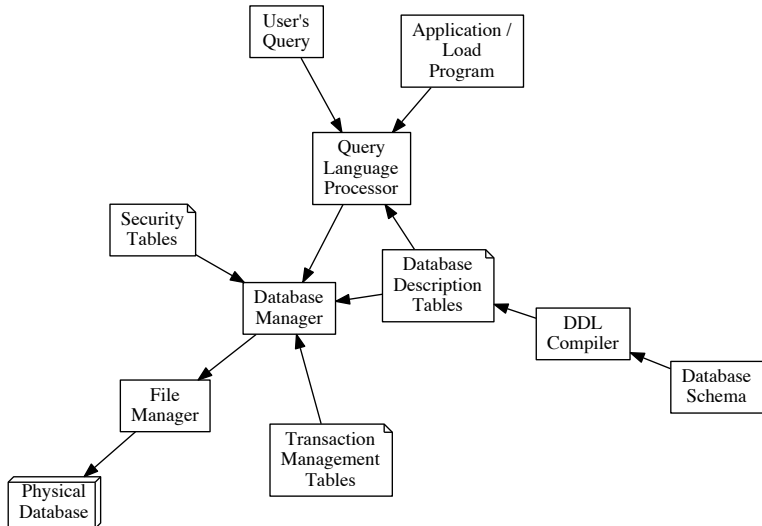

DCL, DDL, DML

- ▶ may be completely separate (in IMS)
- ▶ may be intermixed (DB2)
- ▶ Host language
 - ▶ application program in which DML commands are embedded such as COBOL or PL/I

DBMS COMPONENTS

OVERALL DBMS USAGE SCENARIO

- ▶ Database Administrator (DBA) define the conceptual, logical, and physical levels using DDL
- ▶ DBMS software stores instances of these in schemas
- ▶ User defines views (External Schema) in DDL
- ▶ User accesses database using DML

ADVANTAGES OF A DATABASE

- ▶ Controlled redundancy
- ▶ Reduced inconsistency in the data
- ▶ Shared access to data
- ▶ Standards enforced
- ▶ Security restrictions maintained
- ▶ Integrity maintained more easily
- ▶ Provides capability for backup and recovery
- ▶ Permitting inferences and actions using rules

DISADVANTAGES OF A DATABASE

- ▶ Increased complexity needed to implement concurrency control
- ▶ Increased complexity needed for centralized access control
- ▶ Security needed to allow the sharing of data
- ▶ Necessary redundancies can cause complexity when updating

DATA vs. INFORMATION

Discuss data and information: what is the difference?
